

ABSTRACT OF THE DISCLOSURE

METHOD FOR FORMING A CARBON-CARBON OR
CARBON-HETEROATOM BOND

5

The invention relates to a method for forming a carbon-carbon or carbon-heteroatom bond by reacting an unsaturated compound carrying a leaving group and a
10 nucleophilic compound, in the absence of a ligand. The aim of the invention is especially to form carbon-nitrogen bonds according to a method for the arylation of nitrogenated organic derivatives. According to the inventive method, a carbon-carbon or carbon-heteroatom
15 bond is formed by reacting an unsaturated compound carrying a leaving group with a nucleophilic compound donating a carbon atom or a heteroatom (HE) that can substitute the leaving group, thus forming a C-C or C-HE bond, in the presence of a copper-based catalyst and
20 a base. Said metal is characterised in that the reaction takes place in the absence of a ligand and in a nitrile-type solvent.
